

VITAMIN C INFUSION THERAPY

Do you often feel tired, overworked and your eating habits are far from ideal?

Are you in an acute stage of an inflammatory disease, having allergic reactions or experiencing any of the frequent chronic inflammatory processes, such as Lyme disease, herpes zoster, rheumatic disease, chlamydia infections of the lungs or genitourinary system?

If some of these questions sound familiar, vitamin C treatment will surely help your immune system get started which will then be able to manage infections, inflammation or fatigue better.

Since vitamin C, as the strongest antioxidant, also contributes to the targeted elimination of cancer cells and prevents metastasis, it is very much useful in oncology patients as a supplementary treatment. It improves the course of chemotherapy and radiotherapy by reducing their adverse effects and stimulating the immune system.

When is treatment with high dose intravenous vitamin C appropriate?

- stress, increased physical activity and mental stress, mental disorders (burnout syndrome, depression, anxiety disorder, insomnia), recurrent infection

(influenza, angina, cold, cough, herpes, chlamydial infection), chronic fatigue syndrome, allergies, autoimmune diseases (rheumatoid arthritis, intestinal inflammation), borreliosis, cancer, migraine, and as support for wound healing after surgery.
